

CIRCUIT DESCRIPTION

1. Balance EQ Circuit

Connect two EQ amps (exactly the same circuit) as shown in the figure. With regard to the COLD side input, connect the HOT side NF resistance to the COLD side inversion input.

The HOT side operates in the same manner as in the case of the conventional EQ circuit.

When the HOT side is operated, gate Q7 is connected virtually.

With regard to the COLD side, voltage, which is applied to gate Q5, is applied to the inversion input.

The characteristics of this amp gain is obtained by

$$GAIN = 1 + \frac{2(RIAA)}{RNF}$$

2. Balance Volume Circuit

This pre amp employs a balance volume circuit. In addition, by combining with variable and GAIN AMP it improves S/N.

When this pre amp is operating or when VRMIN, the NF resistance becomes a maximum of 6.1K and the gain is also reduced at the same time as input is reduced.

$$GAIN \text{ When VRMA} = 1 + \frac{316K \times 2}{11K} \approx 6.7 \text{ times (16.5dB)}$$

$$\text{When VRMIN} = 1 + \frac{316K \times 2}{61K} \approx 2 \text{ times (6.0dB)}$$

3. Balance to Unbalance Conversion Amp

This amp converts the signal transmitted at balance to the unbalance signal. It negates external noise signals generated in phase at the HOT and COLD sides, and extracts the desired signal only.

In this per amp, the constant has been set to obtain output voltage, which is 1/2 that of the input voltage between HOT and COLD.

$$GAIN = \frac{R_2}{R_1} \cdot \frac{R_2}{2R_1} \cdot \frac{1}{2}$$

where $R_1 = 2R_2$ is set

CIRCUIT DESCRIPTION

4. Unbalance to Balance Conversion Amp

In this amp the unbalance signal, which is input at the RCA pin, etc., is applied to the noninverting input of the A side amp. As the output and inversion input are directly connected in this amp, it operates as a GAIN=1 buffer amp, and outputs signal to positive phase (HOT).

B side amp grounds noninverting input, and operates as an inversion amp in which NF resistance is set to the same value ($R_1=R_2$).

When A amp (positive phase) output is input, then the negative-phase output (COLD), which is an inverted phase, is output.

The output voltage of this circuit (between HOT and COLD) is twice as large as the input voltage.

5. Microcomputer Port Extension IC TC74HC237AP

This microcomputer port extension IC is to utilize the microcomputer port effectively. The microcomputer output signal, which is encoded to 3 bits, is decoded to six relay control signals.

CIRCUIT DESCRIPTION

Pre Amp Unit (X08-2362-70)

1. EQ Circuit OP Amplifier (IC1, 2)

Two sets of EQ circuits are used per 1CH as this OP amplifier has balance EQ. The HOT side (noninverting amplifier) is a conventional EQ circuit, and the COLD side (inverting amplifier) receives an NF (feed-back) signal of the HOT side which is added to the inverting input. By doing so, the inverted output can be obtained.
